

The EWP-202C annunciator system is designed with dual counter active-infrared technology. The invisible dual infrared beam triggers a chime sound and registers a count on the digital counter when the infrared beam is interrupted. The transmitting signal differentiates among the Entries and Exits therefore making it a more efficient device. The system counts the number of people that enter the facility and sounds a chime upon entering and single sound upon exiting. Each event is counted, recorded and registered by the built-in digital counter and can be viewed and compared later in Entry/Exit modes. The annunciator is also equipped with an Alert Mode which sounds the built-in siren when triggered adding additional security.
